Problem 971: Flip Binary Tree To Match Preorder Traversal

Problem Information

Difficulty: Medium
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

You are given the

root

of a binary tree with

n

nodes, where each node is uniquely assigned a value from

1

to

n

. You are also given a sequence of

n

values

voyage

, which is the

desired

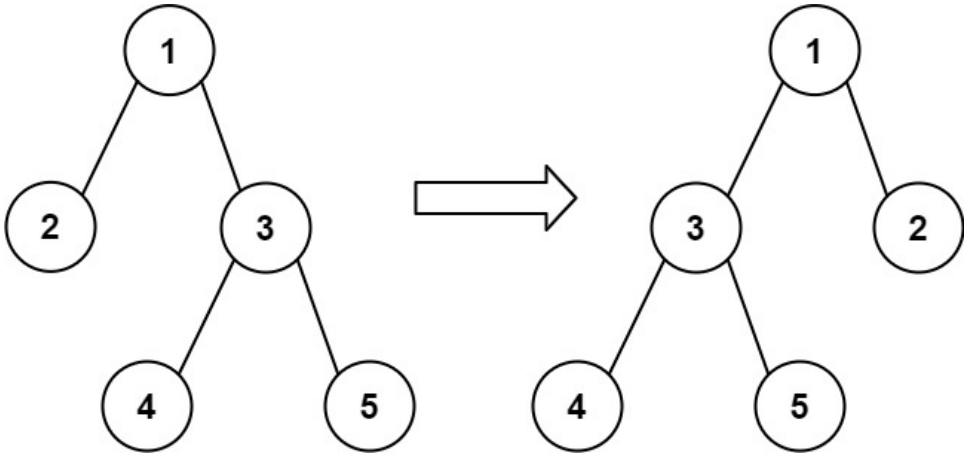
pre-order traversal

of the binary tree.

Any node in the binary tree can be

flipped

by swapping its left and right subtrees. For example, flipping node 1 will have the following effect:



Flip the

smallest

number of nodes so that the

pre-order traversal

of the tree

matches

voyage

.

Return

a list of the values of all

flipped

nodes. You may return the answer in

any order

. If it is

impossible

to flip the nodes in the tree to make the pre-order traversal match

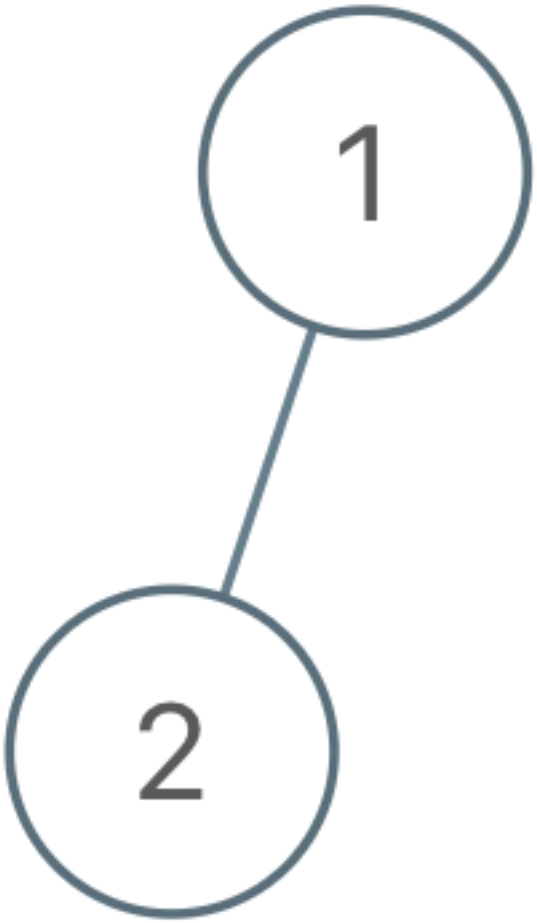
voyage

, return the list

[-1]

.

Example 1:



Input:

root = [1,2], voyage = [2,1]

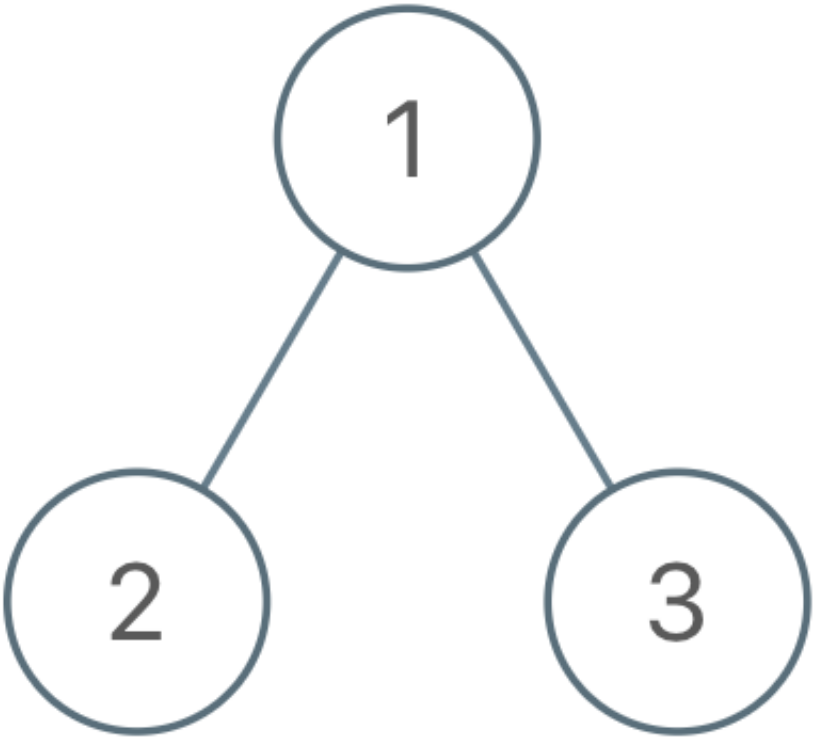
Output:

[-1]

Explanation:

It is impossible to flip the nodes such that the pre-order traversal matches voyage.

Example 2:



Input:

root = [1,2,3], voyage = [1,3,2]

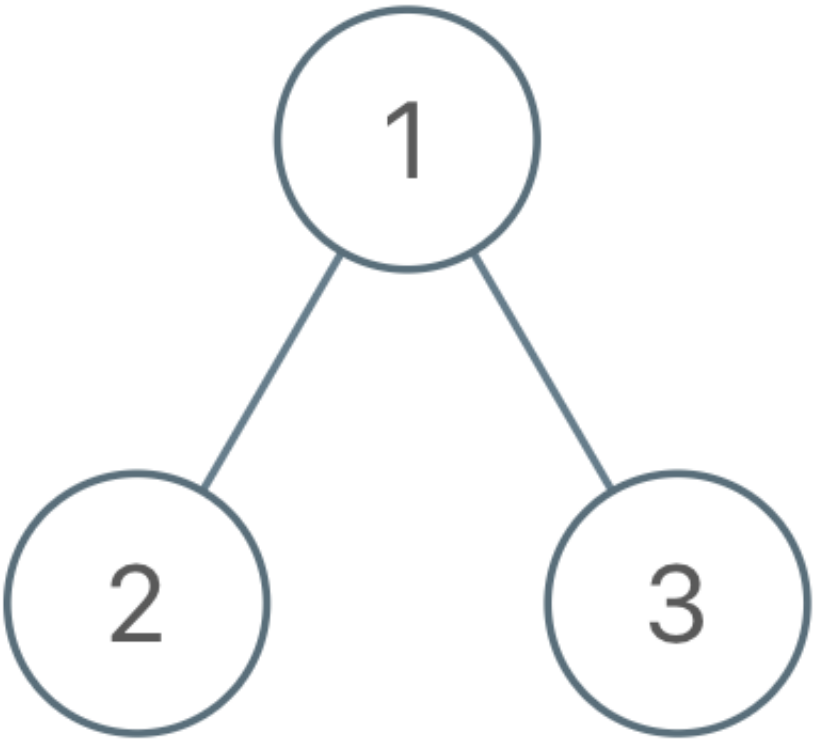
Output:

[1]

Explanation:

Flipping node 1 swaps nodes 2 and 3, so the pre-order traversal matches voyage.

Example 3:



Input:

root = [1,2,3], voyage = [1,2,3]

Output:

[]

Explanation:

The tree's pre-order traversal already matches voyage, so no nodes need to be flipped.

Constraints:

The number of nodes in the tree is

n

.

n == voyage.length

1 <= n <= 100

1 <= Node.val, voyage[i] <= n

All the values in the tree are

unique

.

All the values in

voyage

are

unique

.
