Problem 671: Second Minimum Node In a Binary Tree

Problem Information

Difficulty: Easy
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

Given a non-empty special binary tree consisting of nodes with the non-negative value, where each node in this tree has exactly

two

or

zero

sub-node. If the node has two sub-nodes, then this node's value is the smaller value among its two sub-nodes. More formally, the property

root.val = min(root.left.val, root.right.val)

always holds.

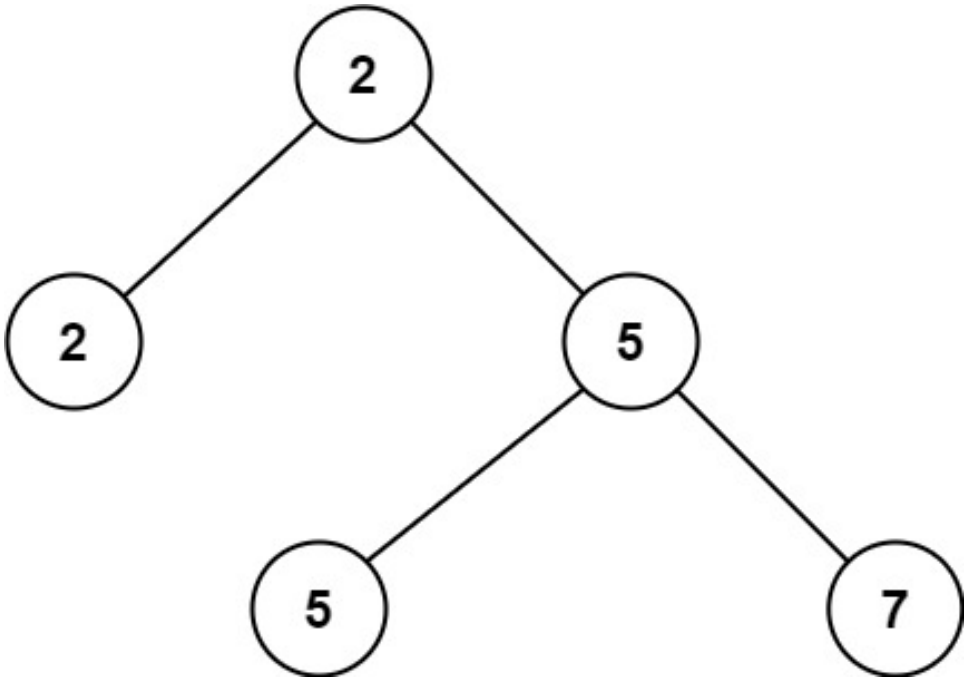
Given such a binary tree, you need to output the

second minimum

value in the set made of all the nodes' value in the whole tree.

If no such second minimum value exists, output -1 instead.

Example 1:



Input:

root = [2,2,5,null,null,5,7]

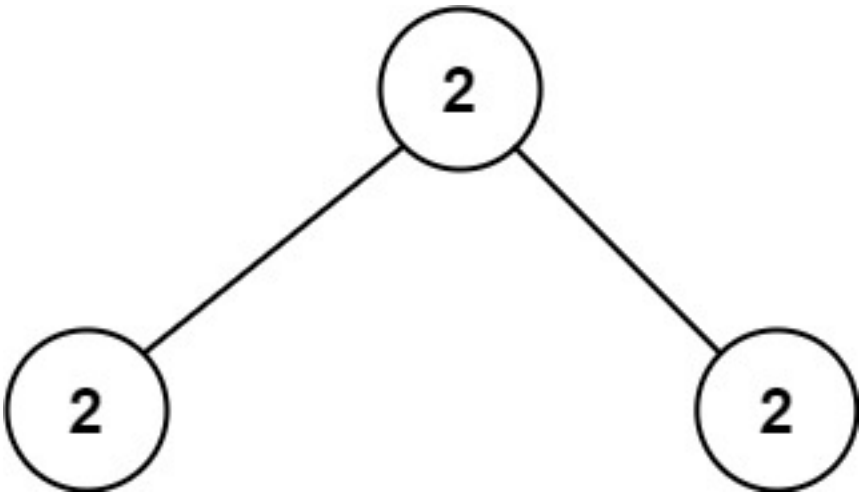
Output:

5

Explanation:

The smallest value is 2, the second smallest value is 5.

Example 2:



Input:

root = [2,2,2]

Output:

-1

Explanation:

The smallest value is 2, but there isn't any second smallest value.

Constraints:

The number of nodes in the tree is in the range

[1, 25]

.

1 <= Node.val <= 2

31

- 1

root.val == min(root.left.val, root.right.val)

for each internal node of the tree.

Code Snippets

C++:

```
