# Problem 106: Construct Binary Tree from Inorder and Postorder Traversal

## Problem Information

**Difficulty:** Medium
**Acceptance Rate:** 0.00%
**Paid Only:** No

## Problem Description

Given two integer arrays

inorder

and

postorder

where

inorder

is the inorder traversal of a binary tree and

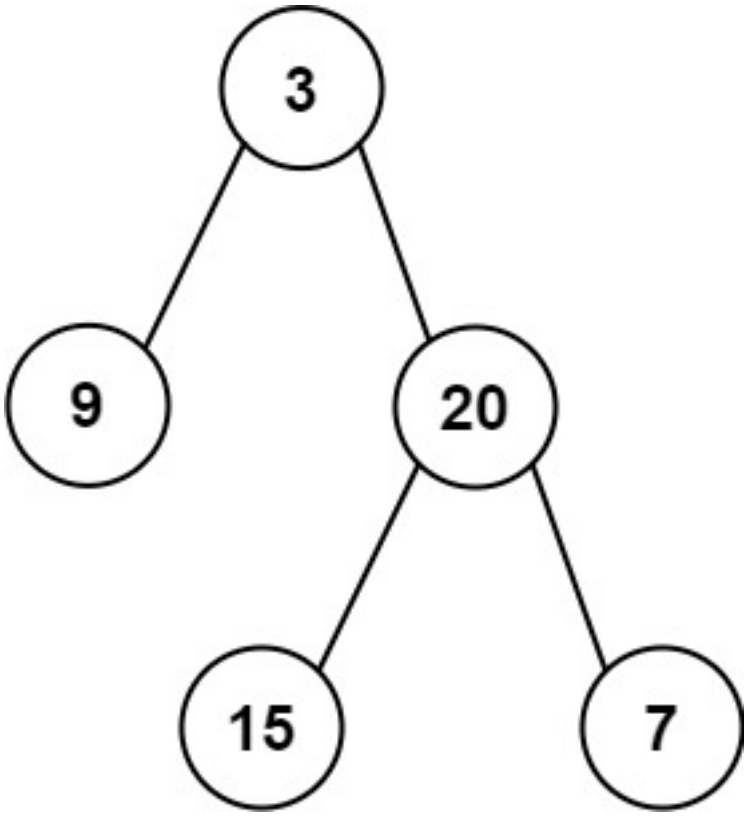
postorder

is the postorder traversal of the same tree, construct and return

the binary tree

.

Example 1:



Input:

inorder = [9,3,15,20,7], postorder = [9,15,7,20,3]

Output:

[3,9,20,null,null,15,7]

Example 2:

Input:

inorder = [-1], postorder = [-1]

Output:

[-1]

Constraints:

1 <= inorder.length <= 3000

postorder.length == inorder.length

-3000 <= inorder[i], postorder[i] <= 3000

inorder

and

postorder

consist of

unique

values.

Each value of

postorder

also appears in

inorder

.

inorder

is

guaranteed

to be the inorder traversal of the tree.

postorder

is

guaranteed

to be the postorder traversal of the tree.

## Code Snippets

**C++:**

```
/**
* Definition for a binary tree node.
* struct TreeNode {
* int val;
* TreeNode *left;
* TreeNode *right;
* TreeNode() : val(0), left(nullptr), right(nullptr) {}
* TreeNode(int x) : val(x), left(nullptr), right(nullptr) {}
* TreeNode(int x, TreeNode *left, TreeNode *right) : val(x), left(left),
right(right) {}
* };
*/
class Solution {
public:
TreeNode* buildTree(vector<int>& inorder, vector<int>& postorder) {

}
};
```

**Java:**

```
/**
* Definition for a binary tree node.
* public class TreeNode {
* int val;
* TreeNode left;
* TreeNode right;
* TreeNode() {}
* TreeNode(int val) { this.val = val; }
* TreeNode(int val, TreeNode left, TreeNode right) {
* this.val = val;
* this.left = left;
* this.right = right;
```

```
* }
* }
*/
class Solution {
public TreeNode buildTree(int[] inorder, int[] postorder) {

}
}
```

**Python3:**

```
# Definition for a binary tree node.
# class TreeNode:
# def __init__(self, val=0, left=None, right=None):
# self.val = val
# self.left = left
# self.right = right
