Problem 1325: Delete Leaves With a Given Value

Problem Information

Difficulty: Medium
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

Given a binary tree

root

and an integer

target

, delete all the

leaf nodes

with value

target

.

Note that once you delete a leaf node with value

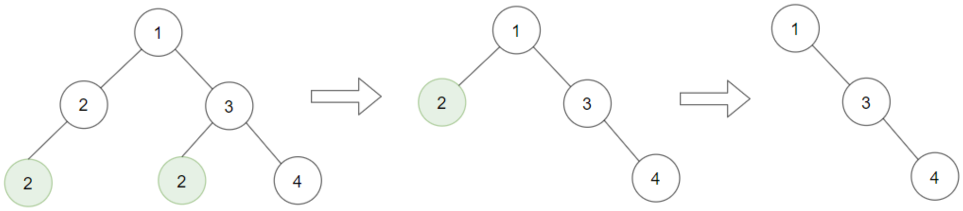
target

,

if its parent node becomes a leaf node and has the value target

, it should also be deleted (you need to continue doing that until you cannot).

Example 1:



Input:

root = [1,2,3,2,null,2,4], target = 2

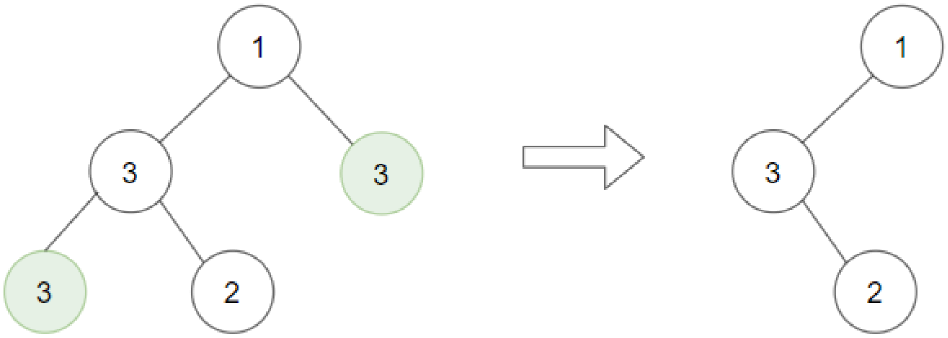
Output:

[1,null,3,null,4]

Explanation:

Leaf nodes in green with value (target = 2) are removed (Picture in left). After removing, new nodes become leaf nodes with value (target = 2) (Picture in center).

Example 2:



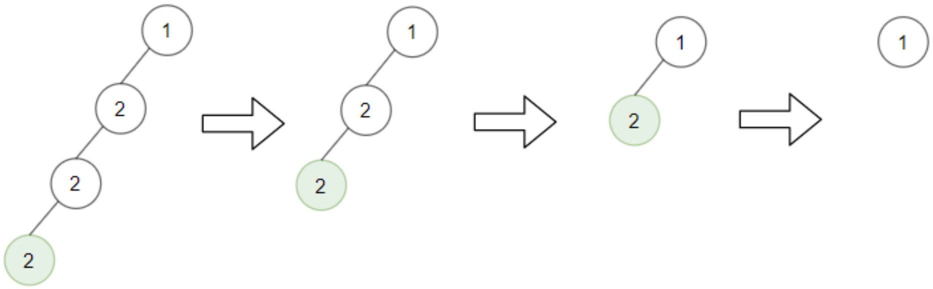
Input:

root = [1,3,3,3,2], target = 3

Output:

[1,3,null,null,2]

Example 3:



Input:

root = [1,2,null,2,null,2], target = 2

Output:

[1]

Explanation:

Leaf nodes in green with value (target = 2) are removed at each step.

Constraints:

The number of nodes in the tree is in the range

[1, 3000]

.

1 <= Node.val, target <= 1000

Code Snippets

C++:

```
/**
* Definition for a binary tree node.
