Problem 563: Binary Tree Tilt

Problem Information

Difficulty: Easy
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

Given the

root

of a binary tree, return

the sum of every tree node's

tilt

.

The

tilt

of a tree node is the

absolute difference

between the sum of all left subtree node

values

and all right subtree node

values

. If a node does not have a left child, then the sum of the left subtree node

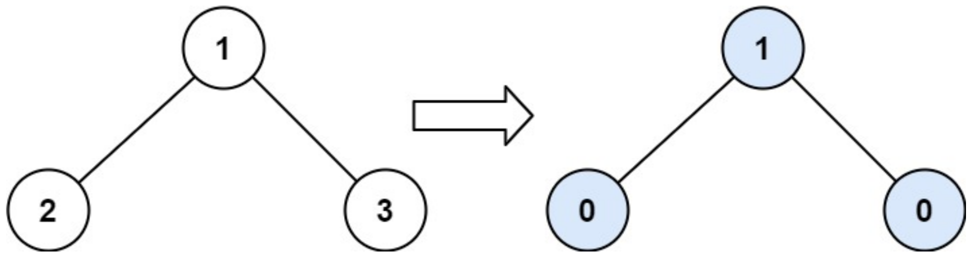
values

is treated as

0

. The rule is similar if the node does not have a right child.

Example 1:



Input:

root = [1,2,3]

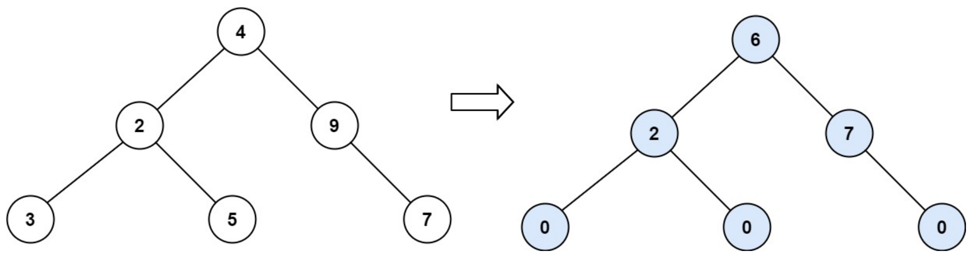
Output:

1

Explanation:

Tilt of node 2 : |0-0| = 0 (no children) Tilt of node 3 : |0-0| = 0 (no children) Tilt of node 1 : |2-3| = 1 (left subtree is just left child, so sum is 2; right subtree is just right child, so sum is 3) Sum of every tilt : 0 + 0 + 1 = 1

Example 2:



Input:

root = [4,2,9,3,5,null,7]

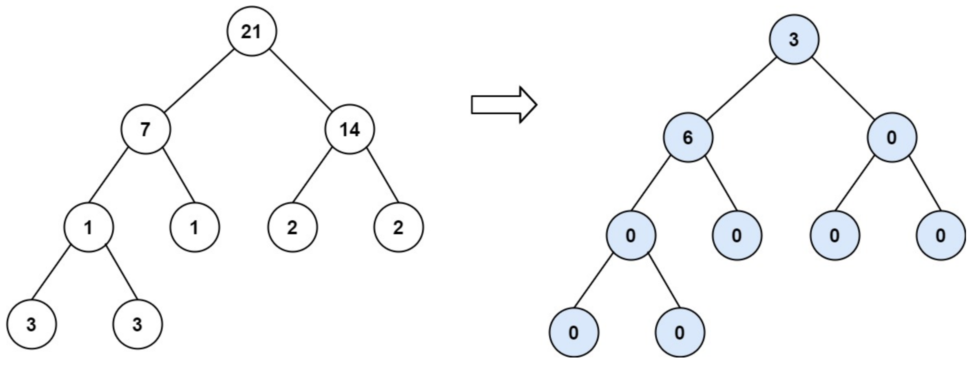
Output:

15

Explanation:

Tilt of node 3 : |0-0| = 0 (no children) Tilt of node 5 : |0-0| = 0 (no children) Tilt of node 7 : |0-0| = 0 (no children) Tilt of node 2 : |3-5| = 2 (left subtree is just left child, so sum is 3; right subtree is just right child, so sum is 5) Tilt of node 9 : |0-7| = 7 (no left child, so sum is 0; right subtree is just right child, so sum is 7) Tilt of node 4 : |(3+5+2)-(9+7)| = |10-16| = 6 (left subtree values are 3, 5, and 2, which sums to 10; right subtree values are 9 and 7, which sums to 16) Sum of every tilt : 0 + 0 + 0 + 2 + 7 + 6 = 15

Example 3:



Input:

root = [21,7,14,1,1,2,2,3,3]

Output:

9

Constraints:

The number of nodes in the tree is in the range

[0, 10

4

]

.

-1000 <= Node.val <= 1000
