Problem 701: Insert into a Binary Search Tree

Problem Information

Difficulty: Medium
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

You are given the

root

node of a binary search tree (BST) and a

value

to insert into the tree. Return

the root node of the BST after the insertion

. It is

guaranteed

that the new value does not exist in the original BST.

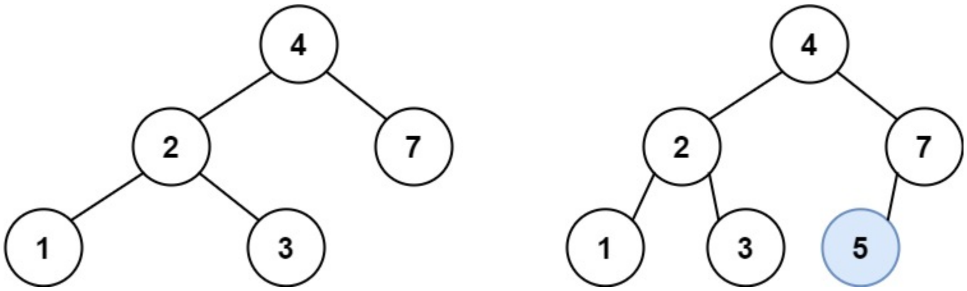
Notice

that there may exist multiple valid ways for the insertion, as long as the tree remains a BST after insertion. You can return

any of them

.

Example 1:



Input:

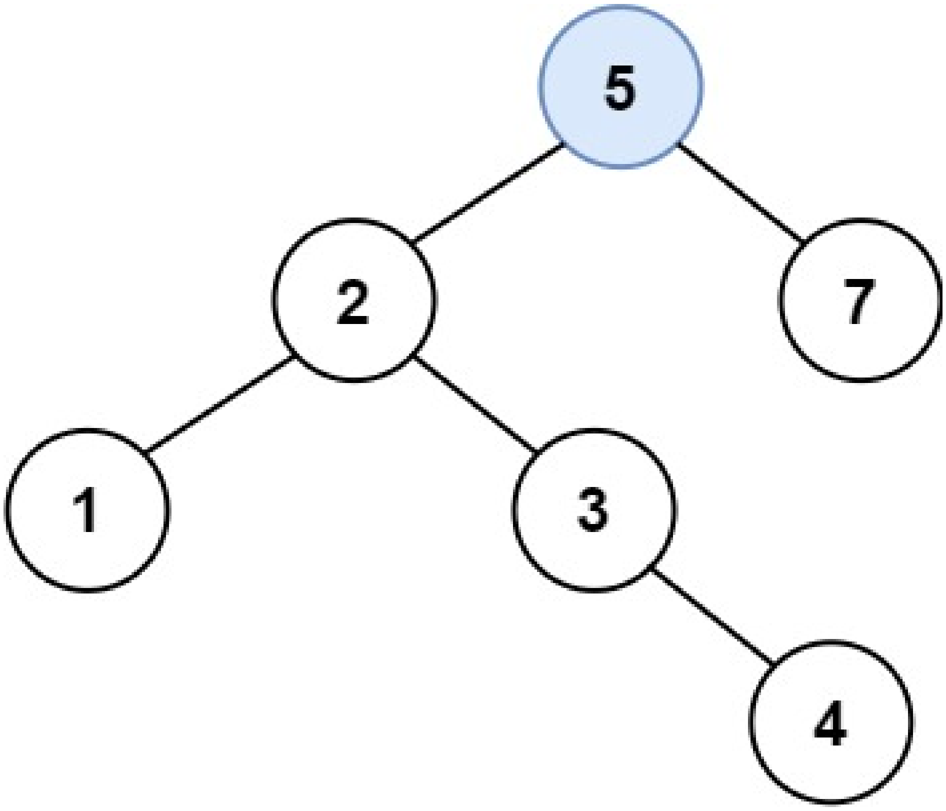
root = [4,2,7,1,3], val = 5

Output:

[4,2,7,1,3,5]

Explanation:

Another accepted tree is:



Example 2:

Input:

root = [40,20,60,10,30,50,70], val = 25

Output:

[40,20,60,10,30,50,70,null,null,25]

Example 3:

Input:

root = [4,2,7,1,3,null,null,null,null,null,null], val = 5

Output:

[4,2,7,1,3,5]

Constraints:

The number of nodes in the tree will be in the range

[0, 10

4

]

.

-10

8

<= Node.val <= 10

8

All the values

Node.val

are

unique

.

-10

8

<= val <= 10

8

It's

guaranteed

that

val

does not exist in the original BST.
