Problem 536: Construct Binary Tree from String

Problem Information

Difficulty: Medium
Acceptance Rate: 0.00%
Paid Only: No

Problem Description

You need to construct a binary tree from a string consisting of parenthesis and integers.

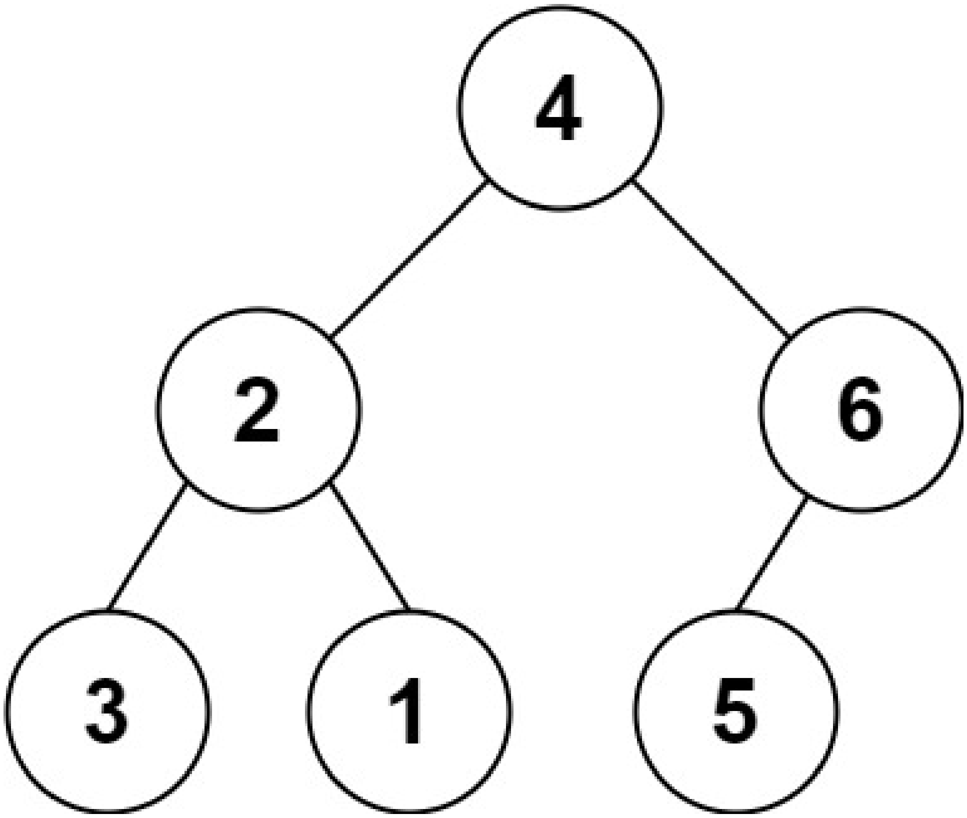
The whole input represents a binary tree. It contains an integer followed by zero, one or two pairs of parenthesis. The integer represents the root's value and a pair of parenthesis contains a child binary tree with the same structure.

You always start to construct the

left

child node of the parent first if it exists.

Example 1:



Input:

s = "4(2(3)(1))(6(5))"

Output:

[4,2,6,3,1,5]

Example 2:

Input:

s = "4(2(3)(1))(6(5)(7))"

Output:

[4,2,6,3,1,5,7]

Example 3:

Input:

s = "-4(2(3)(1))(6(5)(7))"

Output:

[-4,2,6,3,1,5,7]

Constraints:

0 <= s.length <= 3 * 10

4

s

consists of digits,

'('

,

')'

, and

'-'

only.

All numbers in the tree have value

at most

than

2

30

.

Code Snippets

C++:

```
/**
* Definition for a binary tree node.
