

Problem 734: Sentence Similarity

Problem Information

Difficulty: Easy

Acceptance Rate: 44.68%

Paid Only: Yes

Tags: Array, Hash Table, String

Problem Description

We can represent a sentence as an array of words, for example, the sentence ``I am happy with leetcode'' can be represented as `arr = ["I", "am", "happy", "with", "leetcode"]`.

Given two sentences `sentence1` and `sentence2` each represented as a string array and given an array of string pairs `similarPairs` where `similarPairs[i] = [xi, yi]` indicates that the two words `xi` and `yi` are similar.

Return `_true_` if `sentence1` and `sentence2` are similar, or `false` if they are not similar_.

Two sentences are similar if:

* They have **the same length** (i.e., the same number of words) * `sentence1[i]` and `sentence2[i]` are similar.

Notice that a word is always similar to itself, also notice that the similarity relation is not transitive. For example, if the words `a` and `b` are similar, and the words `b` and `c` are similar, `a` and `c` are **not necessarily similar**.

Example 1:

Input: sentence1 = ["great", "acting", "skills"], sentence2 = ["fine", "drama", "talent"],
similarPairs = [["great", "fine"], ["drama", "acting"], ["skills", "talent"]] **Output:** true
Explanation: The two sentences have the same length and each word i of sentence1 is also similar to the corresponding word in sentence2.

Example 2:

****Input:**** sentence1 = ["great"], sentence2 = ["great"], similarPairs = [] ****Output:**** true
****Explanation:**** A word is similar to itself.

****Example 3:****

****Input:**** sentence1 = ["great"], sentence2 = ["doubleplus", "good"], similarPairs = [["great", "doubleplus"]]

****Output:**** false ****Explanation:**** As they don't have the same length, we return false.

****Constraints:****

* `1 <= sentence1.length, sentence2.length <= 1000` * `1 <= sentence1[i].length, sentence2[i].length <= 20` * `sentence1[i]` and `sentence2[i]` consist of English letters. * `0 <= similarPairs.length <= 1000` * `similarPairs[i].length == 2` * `1 <= xi.length, yi.length <= 20` * `xi` and `yi` consist of lower-case and upper-case English letters. * All the pairs `(xi, yi)` are **distinct**.

Code Snippets

C++:

```
class Solution {  
public:  
    bool areSentencesSimilar(vector<string>& sentence1, vector<string>& sentence2, vector<vector<string>>& similarPairs) {  
  
    }  
};
```

Java:

```
class Solution {  
public boolean areSentencesSimilar(String[] sentence1, String[] sentence2,  
List<List<String>> similarPairs) {  
  
}  
}
```

Python3:

```
class Solution:  
    def areSentencesSimilar(self, sentence1: List[str], sentence2: List[str],  
                           similarPairs: List[List[str]]) -> bool:
```
