

# Problem 2119: A Number After a Double Reversal

## Problem Information

**Difficulty:** Easy

**Acceptance Rate:** 81.62%

**Paid Only:** No

**Tags:** Math

## Problem Description

\*\*Reversing\*\* an integer means to reverse all its digits.

\* For example, reversing `2021` gives `1202`. Reversing `12300` gives `321` as the \*\*leading zeros are not retained\*\*.

Given an integer `num`, \*\*reverse\*\* `num` to get `reversed1`, \*\*then reverse\*\* `reversed1` to get `reversed2`. Return `true` \_if\_ `reversed2` \_equals\_ `num`. Otherwise return `false`.

\*\*Example 1:\*\*

\*\*Input:\*\* num = 526 \*\*Output:\*\* true \*\*Explanation:\*\* Reverse num to get 625, then reverse 625 to get 526, which equals num.

\*\*Example 2:\*\*

\*\*Input:\*\* num = 1800 \*\*Output:\*\* false \*\*Explanation:\*\* Reverse num to get 81, then reverse 81 to get 18, which does not equal num.

\*\*Example 3:\*\*

\*\*Input:\*\* num = 0 \*\*Output:\*\* true \*\*Explanation:\*\* Reverse num to get 0, then reverse 0 to get 0, which equals num.

\*\*Constraints:\*\*

\* `0 <= num <= 10<sup>6</sup>`

## Code Snippets

### C++:

```
class Solution {  
public:  
    bool isSameAfterReversals(int num) {  
  
    }  
};
```

### Java:

```
class Solution {  
    public boolean isSameAfterReversals(int num) {  
  
    }  
}
```

### Python3:

```
class Solution:  
    def isSameAfterReversals(self, num: int) -> bool:
```
