

Problem 1750: Minimum Length of String After Deleting Similar Ends

Problem Information

Difficulty: Medium

Acceptance Rate: 55.98%

Paid Only: No

Tags: Two Pointers, String

Problem Description

Given a string `s` consisting only of characters ``a``, ``b``, and ``c``. You are asked to apply the following algorithm on the string any number of times:

1. Pick a **non-empty** prefix from the string `s` where all the characters in the prefix are equal.
2. Pick a **non-empty** suffix from the string `s` where all the characters in this suffix are equal.
3. The prefix and the suffix should not intersect at any index.
4. The characters from the prefix and suffix must be the same.
5. Delete both the prefix and the suffix.

Return _the**minimum length** of _`s` _after performing the above operation any number of times (possibly zero times)_.

Example 1:

Input: s = "ca" **Output:** 2 **Explanation:** You can't remove any characters, so the string stays as is.

Example 2:

Input: s = "cabaabac" **Output:** 0 **Explanation:** An optimal sequence of operations is:
- Take prefix = "c" and suffix = "c" and remove them, s = "abaaba".
- Take prefix = "a" and suffix = "a" and remove them, s = "baab".
- Take prefix = "b" and suffix = "b" and remove them, s = "aa".
- Take prefix = "a" and suffix = "a" and remove them, s = "".

Example 3:

Input: s = "aabccabba" **Output:** 3 **Explanation:** An optimal sequence of operations is:
- Take prefix = "aa" and suffix = "a" and remove them, s = "bccabb".
- Take prefix = "b" and suffix = "bb" and remove them, s = "cca".

Constraints:

* `1 <= s.length <= 105` * `s` only consists of characters 'a', 'b', and 'c'.

Code Snippets

C++:

```
class Solution {  
public:  
    int minimumLength(string s) {  
  
    }  
};
```

Java:

```
class Solution {  
public int minimumLength(String s) {  
  
}  
}
```

Python3:

```
class Solution:  
    def minimumLength(self, s: str) -> int:
```
