

Problem 2946: Matrix Similarity After Cyclic Shifts

Problem Information

Difficulty: **Easy**

Acceptance Rate: 0.00%

Paid Only: No

Problem Description

You are given an

$m \times n$

integer matrix

mat

and an integer

k

. The matrix rows are 0-indexed.

The following process happens

k

times:

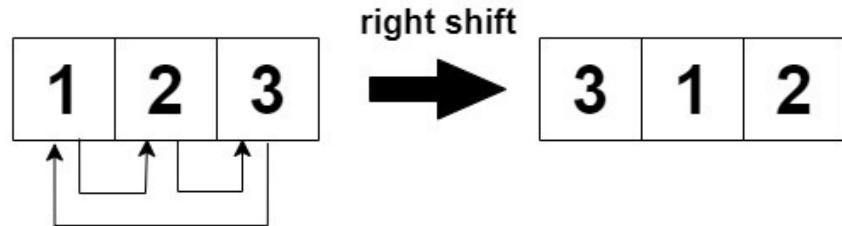

Even-indexed

rows (0, 2, 4, ...) are cyclically shifted to the left.

Odd-indexed

rows (1, 3, 5, ...) are cyclically shifted to the right.

Return

true

if the final modified matrix after

k

steps is identical to the original matrix, and

false

otherwise.

Example 1:

Input:

mat = [[1,2,3],[4,5,6],[7,8,9]], k = 4

Output:

false

Explanation:

In each step left shift is applied to rows 0 and 2 (even indices), and right shift to row 1 (odd index).

The diagram illustrates a 3x3 matrix transformation. It starts with a matrix:

1	2	3
4	5	6
7	8	9

Four arrows point to subsequent matrices, representing row shifts:

- Step 1: Matrix $\begin{bmatrix} 2 & 3 & 1 \\ 6 & 4 & 5 \\ 8 & 9 & 7 \end{bmatrix}$
- Step 2: Matrix $\begin{bmatrix} 3 & 1 & 2 \\ 5 & 6 & 4 \\ 9 & 7 & 8 \end{bmatrix}$
- Step 3: Matrix $\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$
- Step 4: Matrix $\begin{bmatrix} 2 & 3 & 1 \\ 6 & 4 & 5 \\ 8 & 9 & 7 \end{bmatrix}$

Example 2:

Input:

mat = [[1,2,1,2],[5,5,5,5],[6,3,6,3]], k = 2

Output:

true

Explanation:

The diagram illustrates a 4x4 matrix transformation. It starts with a matrix:

1	2	1	2
5	5	5	5
6	3	6	3

Two arrows point to subsequent matrices, representing row shifts:

- Step 1: Matrix $\begin{bmatrix} 2 & 1 & 2 & 1 \\ 5 & 5 & 5 & 5 \\ 3 & 6 & 3 & 6 \end{bmatrix}$
- Step 2: Matrix $\begin{bmatrix} 1 & 2 & 1 & 2 \\ 5 & 5 & 5 & 5 \\ 6 & 3 & 6 & 3 \end{bmatrix}$

Example 3:

Input:

mat = [[2,2],[2,2]], k = 3

Output:

true

Explanation:

As all the values are equal in the matrix, even after performing cyclic shifts the matrix will remain the same.

Constraints:

$1 \leq \text{mat.length} \leq 25$

$1 \leq \text{mat[i].length} \leq 25$

$1 \leq \text{mat[i][j]} \leq 25$

$1 \leq k \leq 50$

Code Snippets

C++:

```
class Solution {
public:
    bool areSimilar(vector<vector<int>>& mat, int k) {
        }
    };
}
```

Java:

```
class Solution {
public boolean areSimilar(int[][] mat, int k) {
        }
    }
}
```

Python3:

```
class Solution:
    def areSimilar(self, mat: List[List[int]], k: int) -> bool:
```

Python:

```
class Solution(object):
    def areSimilar(self, mat, k):
        """
        :type mat: List[List[int]]
        :type k: int
        :rtype: bool
        """
```

JavaScript:

```
/**
 * @param {number[][]} mat
 * @param {number} k
 * @return {boolean}
 */
var areSimilar = function(mat, k) {
}
```

TypeScript:

```
function areSimilar(mat: number[][], k: number): boolean {
}
```

C#:

```
public class Solution {
    public bool AreSimilar(int[][] mat, int k) {
    }
}
```

C:

```
bool areSimilar(int** mat, int matSize, int* matColSize, int k) {
}
```

Go:

```
func areSimilar(mat [][]int, k int) bool {  
    }  
}
```

Kotlin:

```
class Solution {  
    fun areSimilar(mat: Array<IntArray>, k: Int): Boolean {  
        }  
    }  
}
```

Swift:

```
class Solution {  
    func areSimilar(_ mat: [[Int]], _ k: Int) -> Bool {  
        }  
    }  
}
```

Rust:

```
impl Solution {  
    pub fn are_similar(mat: Vec<Vec<i32>>, k: i32) -> bool {  
        }  
    }  
}
```

Ruby:

```
# @param {Integer[][]} mat  
# @param {Integer} k  
# @return {Boolean}  
def are_similar(mat, k)  
  
end
```

PHP:

```
class Solution {  
  
    /**  
     * @param Integer[][] $mat  
     */  
    function areSimilar($mat, $k) {  
        }  
    }  
}
```

```
* @param Integer $k
* @return Boolean
*/
function areSimilar($mat, $k) {

}

}
```

Dart:

```
class Solution {
bool areSimilar(List<List<int>> mat, int k) {

}
```

Scala:

```
object Solution {
def areSimilar(mat: Array[Array[Int]], k: Int): Boolean = {

}
```

Elixir:

```
defmodule Solution do
@spec are_similar(mat :: [[integer]], k :: integer) :: boolean
def are_similar(mat, k) do

end
end
```

Erlang:

```
-spec are_similar(Mat :: [[integer()]], K :: integer()) -> boolean().
are_similar(Mat, K) ->
.
```

Racket:

```
(define/contract (are-similar mat k)
  (-> (listof (listof exact-integer?)) exact-integer? boolean?))
)
```

Solutions

C++ Solution:

```
/*
 * Problem: Matrix Similarity After Cyclic Shifts
 * Difficulty: Easy
 * Tags: array, math
 *
 * Approach: Use two pointers or sliding window technique
 * Time Complexity: O(n) or O(n log n)
 * Space Complexity: O(1) to O(n) depending on approach
 */

class Solution {
public:
    bool areSimilar(vector<vector<int>>& mat, int k) {

    }
};
```

Java Solution:

```
/**

 *
 * Approach: Use two pointers or sliding window technique
 * Time Complexity: O(n) or O(n log n)
 * Space Complexity: O(1) to O(n) depending on approach
 */

function areSimilar(mat: number[][], k: number): boolean {

};

```

C# Solution:

```

/*
 * Problem: Matrix Similarity After Cyclic Shifts
 * Difficulty: Easy
 * Tags: array, math
 *
 * Approach: Use two pointers or sliding window technique
 * Time Complexity: O(n) or O(n log n)
 * Space Complexity: O(1) to O(n) depending on approach
 */

public class Solution {
    public bool AreSimilar(int[][] mat, int k) {

    }
}
```

```
}
```

C Solution:

```
/*
 * Problem: Matrix Similarity After Cyclic Shifts
 * Difficulty: Easy
 * Tags: array, math
 *
 * Approach: Use two pointers or sliding window technique
 * Time Complexity: O(n) or O(n log n)
 * Space Complexity: O(1) to O(n) depending on approach
 */

bool areSimilar(int** mat, int matSize, int* matColSize, int k) {

}
```

Go Solution:

```
// Problem: Matrix Similarity After Cyclic Shifts
// Difficulty: Easy
// Tags: array, math
//
// Approach: Use two pointers or sliding window technique
// Time Complexity: O(n) or O(n log n)
// Space Complexity: O(1) to O(n) depending on approach

func areSimilar(mat [][]int, k int) bool {

}
```

Kotlin Solution:

```
class Solution {
    fun areSimilar(mat: Array<IntArray>, k: Int): Boolean {
        }
}
```

Swift Solution:

```

class Solution {
    func areSimilar(_ mat: [[Int]], _ k: Int) -> Bool {
        ...
    }
}

```

Rust Solution:

```

// Problem: Matrix Similarity After Cyclic Shifts
// Difficulty: Easy
// Tags: array, math
//
// Approach: Use two pointers or sliding window technique
// Time Complexity: O(n) or O(n log n)
// Space Complexity: O(1) to O(n) depending on approach

impl Solution {
    pub fn are_similar(mat: Vec<Vec<i32>>, k: i32) -> bool {
        ...
    }
}

```

Ruby Solution:

```

# @param {Integer[][]} mat
# @param {Integer} k
# @return {Boolean}
def are_similar(mat, k)

end

```

PHP Solution:

```

class Solution {

    /**
     * @param Integer[][] $mat
     * @param Integer $k
     * @return Boolean
     */
    function areSimilar($mat, $k) {

```

```
}
```

```
}
```

Dart Solution:

```
class Solution {  
bool areSimilar(List<List<int>> mat, int k) {  
  
}  
}  
}
```

Scala Solution:

```
object Solution {  
def areSimilar(mat: Array[Array[Int]], k: Int): Boolean = {  
  
}  
}  
}
```

Elixir Solution:

```
defmodule Solution do  
@spec are_similar(mat :: [[integer]], k :: integer) :: boolean  
def are_similar(mat, k) do  
  
end  
end
```

Erlang Solution:

```
-spec are_similar(Mat :: [[integer()]], K :: integer()) -> boolean().  
are_similar(Mat, K) ->  
.
```

Racket Solution:

```
(define/contract (are-similar mat k)  
(-> (listof (listof exact-integer?)) exact-integer? boolean?)  
)
```
